Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pp
                                                                                                                                                                                                                                                                                                                                                                                                               ő
                       The sequence encodes the mouse antibody 21.6 heavy chain variable region, Ha, directed against leukocyte adhesion molecule VLA-4. Cloned CDNA sequences of mouse 21.6 VL and VH (AAQ99889 and AAQ99892) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ9985-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids LA5, LA9 LAS and LG9 in the human kappa LC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig L chain. Plasmids encoding the chimmeric antibodies are transfected into COS cells. The humanized antibodies can be used
                                                                                                                                                                                          1.6 Ig L chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial cell and for tracating inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 DPKFQGRVTITADISASTAYMELSSLRSEDTAVYYCAREGYYGNYGVYAMDYWGQGTLVT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple solerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA 4, for affinity purification or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                            chain variable region against leukocyte adhesion molecule VLA-4.
Cloned cDNA sequences of mouse 21.6 VH (Ang99802) and VL (Ang099889)
regions are linked to human constant regions in the construction
of a humanized antibody against VLA-4. The 5' and 3' ends of the
mouse cDNAs are modified using PCR primers (Ang99895-98) and then
subcloned into mammalian cell expression vectors containing human
kappa or gamma-1 constant regions. In the humanized heavy chain,
amino acids 127, 143, 143, 143, 140, 141 and 171 in the human HC VR
position of the mouse 21 6 19 H chain. Plasmids encoding the

This polypeptide, designated Ha, comprises the heavy chain variable region (VH) of a humanised alpha-4 integrin antibody 21.6 (see also AMM22413) It is composed of complementarity determining regions from the VH region (see AMM22410) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human 21/28 CL framework. It can be expressed in mammallan host cells following PCR amplification and mutagenesis of appropriate mouse and human DNA sequences. The humanised 21.6 VH and a humanised 21.6 VL (see AAM22412) can be used to produce a claimed humanised 21.6 antibody that is useful in the manufacture of a medicament for treating asthma, atherosclerosis, canthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psorlasis, myocardial ischemia, and acute leukocyte mediated lung injury. The humanised equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                   /label= CDR3

It is composed of complementarity determining regions (CDRs) from the VH region (see AAW22410) of meuse alpha-4 integrin monoclonal antibody 21.6 and a modified human 21/28 CL framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate fragments of mouse and human bNA sequences. The humanised 21.6 VH and a humanised 21.6 VK (see AAW22412) can be used to produce a claimed humanised 21.6 antibody that is useful in the manufacture of a medicament for treating asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, tumour

                                                                                                                                                                                                                                                                                                                            metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukcoyte mediated lung injury. The antibody for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The sequence represents the mouse anti-VLA-4 antibody 21.6 heavy chain variable region (without signal sequence). Cloned cDNA CDR sequences of mouse 21.6 variable light and variable heavy regions are linked to human constant framework regions of the REI antibody for the 140th chain and antibody against VLA-4. The 5' and 3' ends of the mususe cDNAs are modified using PCR primers (See Ang09895-98) and then subcloned into constant regions. In the humanized light chain, amino acids LA5, LA9, CCS and L69 in the human kappa LCVR framework are replaced by the amino constant regions. In the humanized light chain, amino acids LA5, LA9, CCS acid present in the equivalent position of the mouse 21.6 Ig light chain. Plasmids encoding the chimeric antibodies are transfected into COS collain. Plasmids antibodies can be used to inhibit adhesion of a cleukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used to see used in the treatment of stroke, cused for detecting VLA-4, for affinity purification or for generating entity and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                            /label- CDR2

                                                region directed against leukocyte adhesion molecule VLA-4. Cloned CDNA sequences of mouse 21.6 VH and VL (see AAQ99889) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse CDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1
The sequence represents the mouse antibody 21.6 heavy chain variable
                                                                                                                                                                                                                                                                 flumanized antibody; leukocyte adhesion molecule; VLA-4; therapeutic;

constant regions. In the humanized heavy chain, amino acids H27, H28, H29, H30, H44 and H71 in the human HC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig H chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple sclerosis. They meningtis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating anti-idiotype antibodies.

                                                                                                                                                                                                                                                                                                                                                                              This polypeptide comprises the heavy chain variable region (VH) of mouse anti-alpha-4 integrin monoclonal antibody 21.6. The complementarity determining regions (CDRs) of the 21.6 VH can be incorporated into a human 21/28'CL framework to produce a claimed humanised 21.6 VH (see AAW22413) and a claimed humanised 21.6 rantibody that is used in the manufacture of a medicament for treating a disease selected from asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin generating idiotypic antibodies. The humanised antibodies of the inventon have a half-life in the human circulation essentially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the heavy chain variable region of the humanised murine anti-human cancer antigen antibody (Ab) NR-LU-13,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hAb, specifically NRX451, or its conjugates can be used for the manufacture of a diagnostic or medicament for cancer diagnosis or treatment. The hAb has reduced immunogenicity and toxicity in humans, but retains the ability to bind the NR-LU-13 antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB 19; Length 120;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1;
                                                                                                                                                                                                                                                                                The invention relates to the humanised antibody NRX 451 (or an antigenbinding fragment), in which the murine parent antibody is ATCC CRL-12360 (also known as NU-LU-13 which targets a 40 kilodalton glycoprotein expressed by many carcinomas) and which comprises the light chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79033 and the heavy chain variable region appearing as AAU79033 and the nearly man is a milbody is a humanised antibody derived from NR-LU-13 amples. The antibody is a humanised antibody derived from NR-LU-13 antigen. The antibody glycosylation or its N-linked glycosylation or its N-linked glycosylation are specially. The present sequence represents the heavy chain variable region of humanised antibody of the invention, NRX451.
                                                                                                                                                                                                              Humanised antibody NRX-451, which is derived from ATCC CRL-12360, but which has reduced immunogenicity or toxicity, useful for diagnosing and

The present sequence encodes a fusion of the single chain antibody bunkr.LD-10 and streptavidin. The antibody binds the antigen EGP40 or EPCAM. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a first nucleic acid operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a vector construct comprises a first nucleic acid operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a vector construct comprises a first nucleic acid encoding at least comprises a first nucleic acid encoding at least comprise and in streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer, e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the

The present sequence is a fragment of the chimaeric human/murine monoclonal antibody (MAD) ONS-M21. The MAD was prepd. by combining light and heavy variable region DNA, from a murine anti-human myeloblastoma cell MAD, with human light and heavy constant region sequences, respectively to produce chimaeric human/murine light and heavy and light chain DNA mols. A recombinant vector of for the expression of the heavy and light chain DNA mols. was prepd., and used to transform a host cell. The host cell was then cultured, and the expression prods. of the heavy and light chain CNA mols. sepd. and connected with a peptide linker to produce a single stranded Fv region. The reshaped Fv region has low human antigenicity, and is therefore expected to be useful as an agent for the diagnosis and treatment of cerebral tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 DPKFQGRVTITADTSASTAYMELSSLRSEDTAVYYCAREGYYGNYGVYAMDYWGQGTLVT 120

                                                                                                                       Plasmid pSCFVT7-hM21; human; ONS-M21 antibody; chimeric protein; medulloblastoma; brain tumour; treatment; diagnosis; Fv fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                       AAQ94548 is the plasmid pSCFVT7-hM21, which encodes AAR76682 the human antibody ONS-M21 Fv fragment. The plasmid was used in the construction of an expression vector, contg. cDNA encoding a human/murine chimeric antibody, reactive with human medulloblastoma (a brain tumour) cells. The chimeric antibody can be used in the diagnosis and treatment of this disease.

The present sequence is a scFv fragment from the chimaeric human/murine monoclonal antibody (MAb) ONS-M21. The MAb was preped by combining light and heavy variable region DNA, from a murine anti-human myeloblastoma cell MAb, with human light and heavy constant region sequences, respectively to produce chimaeric human/murine light and heavy chain DNA mols. A recombinant vector of for the expression of the heavy and light chain DNA mols. was prepd., and used to transform a host cell. The host cell was then cultured, and the expression prods. of the heavy and light chain DNA mols. sepd. and connected with a peptide linker to produce a single stranded Fv region. The reshaped Fv region has low human antigenicity, and is therefore expected to be useful as an agent of the diagnosis and treatment of cerebral tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Reshaped anti-human myeloblastoma cell human antibody - has low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human antigenicity, and is therefore useful for diagnosis and
treatment of cerebral tumours, e.g. myeloblastoma
                                                                                                                                                                                                                                                                    Murine; human; myeloblastoma; chimaera; monoclonal antibody; chimera; single stranded Fv region; low human antigenicity; diagnosis; treatment; cerebral tumour; reshaped.

Cloned CDMA sequences of mouse 21.6 VL and VH (AAQ99889 and AAQ99892) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are mainfied using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids 145, by the amino acid present in the equivalent position of the mouse 21.6 If L chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial cell and for inhibiting adhesion of a leukocyte to an endothelial cell and

I can also be used in the treatment of stroke, cerebral traumas, maningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating anti-idiotype antibodies.
